KENKOBO

QUANTITATIVE ENGINEERING FOR MARKETS THAT DON'T FORGIVE.

DUBAI · UAE · 2026

A boutique for desks where decimals are dangerous.

Kenkobo Development is a Dubai-based quantitative research and infrastructure firm. We design market-making strategies, high-fidelity simulators, and real-time data systems for trading desks and product teams whose performance is measured in microseconds and basis points.

Our principals have run live capital up to 40 % of market volume on individual instruments, rebuilt commercial simulators to recover order-level state from sparse snapshots, and shipped real-time ML data pipelines at internet-search scale.

FOUNDED	REGISTERED	FOCUS
Dubai, 2026	Meydan Free Zone	Quant R&D & Infrastructure

Six practice areas. Shipped to production.

01

Market-Making Strategy R&D

RL and neural-network MM models for futures and crypto. From simulator prototype to live capital.

02

High-Fidelity Simulators

Reconstruction of order-level state from 500 ms commercial snapshots. Sim-to-prod parity.

03

Crypto Market Infrastructure

MM and mid-frequency strategies for centralised crypto exchanges. Binance-class connectivity.

04

Real-Time ML Data Pipelines

Online feature aggregation over Real-Time MapReduce. Low-latency feature stores at scale.

05

Microstructure & Capacity Analytics

Order-book studies, capacity modelling, slippage attribution. We know where the ceiling is.

06

Algorithmic Consulting

Code & architecture review, performance audits, technical due diligence, hiring assessment.

Market-Making Strategy R&D

≤ 40 %

OF MARKET VOLUME CAPTURED ON INDIVIDUAL CHINESE FUTURES INSTRUMENTS IN LIVE PRODUCTION.

- → Built from scratch using reinforcement learning and neural networks — profitable in simulation and live.
- → Scaled to nearly every futures contract across all Chinese exchanges.
- → Resilient under regulatory change. Competitors recalibrated each cycle; ours needed only routine tuning, and outperformed.
- → Same toolkit extended to centralised crypto exchanges, paired with mid-term price forecasting on RL.

High-Fidelity Simulators

Commercial market-data feeds publish order-book snapshots every 500 ms. Between snapshots, the order flow is invisible — and naive simulators fill that gap with assumptions that diverge from live behaviour.

```
snapshot t    ┐
              │   modelled
              │   solution
              │   space
snapshot t+1  ┘   →   order-level
                      reconstruction
                      →   sim-to-prod
                          parity
```

- → Reconstruct the feasible order-level state between snapshots by modelling the solution space, not interpolating.
- → Backtest PnL closely tracks live deployment instead of diverging on contact with the market.
- → Resulted in significant uplift in simulator quality and downstream PnL of strategies trained on it.

Crypto Market Infrastructure

Binance-class

CEX CONNECTIVITY, END-TO-END. SIMULATOR, STRATEGY, EXECUTION — BUILT TOGETHER.

- → Bespoke simulator tailored to crypto exchange microstructure — not a futures sim retrofitted.
- → Market-making strategy paired with mid-term price forecasting on reinforcement learning.
- → Profitable in simulation and in live deployment against a tier-one centralised crypto exchange.
- → Extendable to DEX venues and cross-venue arbitrage with shared infrastructure.

Real-Time ML Data Pipelines

search-scale

ONLINE CLICK AGGREGATION,
SUB-SECOND FRESHNESS,
PREDICTABLE COST.

- → Production click-aggregation pipeline built on Real-Time MapReduce.
- → Feeds online ML ranking models for one of the world's largest search engines.
- → Low-latency feature store patterns transfer cleanly to quantitative trading signals.
- → We design for sub-second freshness, deterministic cost, and graceful degradation.

Outcomes in production.

Selected anonymised outcomes from our principals' prior roles and from Kenkobo engagements.

≤ 40 % vol	**Chinese futures market-making.** RL + neural networks, profitable in sim and prod. Scaled to nearly every contract across all Chinese exchanges.
RL · live	**Crypto expansion.** Bespoke simulator and MM strategy with mid-term forecasting. Live against a tier-one centralised crypto exchange.
500 ms → ticks	**Simulator rebuild.** Order-level state reconstructed between commercial snapshots. Significant uplift in simulation fidelity and downstream PnL.
search-scale	**Real-time ranking data.** Online click-aggregation pipeline on Real-Time MapReduce, powering production ML ranking at one of the world's largest search engines.
resilient	**Regulatory robustness.** While competitors retuned each regulatory cycle in Chinese futures, our strategy required only routine recalibration — outperforming through cycles.

Tools we reach for.

Mature engineering choices — C++ where latency rules, Python for research, Rust where the two meet.

Vasilii Mokin — Founder & CEO

MSc in Mathematics, graduated with honours — Faculty of Mechanics and Mathematics, Functional Analysis Division. Nine years of quantitative research and trading systems on the buy side and at internet-search scale.

Recognised by the international mathematics and competitive-programming communities as a top-tier problem solver: gold medallist of the International Mathematical Olympiad and the China Mathematics Olympiad, Codeforces International Grandmaster (peak rating 2990, top-50 worldwide).

Jury member and problem author for mathematics olympiads. Author of several competitive programming contests.

- 2010 IMO — Gold Medal
- 2009 China Math Olympiad — Gold Medal
- 2014 International Student Olympiad, Iran — First Prize
- 2011 IMC for University Students — Second Prize
- 2008, 2010 Russian Math Olympiad — I diploma
- 2012–2016 ACM ICPC NEERC — I diploma (×4)
- peak 2990 Codeforces — International Grandmaster, top-50
